

SelfAssessment11_1

November 9, 2015

1 Exercise 11.1:

Find the full path of one of your commonly-used programs. Write a Python program run that program. Verify that your program works: Run the Python program and see if the other program starts.

Answer appears after one blank page (so you don't peek).

Are you sure you're ready to peek?

2 Possible Solution:

One of my most commonly used programs is RStudio. It is located at:
C:/Program Files/RStudio/bin/rstudio.exe:

```
In [1]: import os

        file_path = r"C:\Program Files\RStudio\bin\rstudio.exe"

        os.startfile(file_path)
```

It worked. If your program is in the Windows PATH then you can run it without the full path name.
